1 BRIEF

- 1.1.1 Enertek international Limited (EIL), were contracted to receive, install, and commission a production sample, of the IDEAL POD i405 HIU. This is a variant of the IDEAL POD i505 HIU, the data and results of which can be found in report IDEAL POD i505 E4522-1A.
- 1.1.2 Enertek international Limited (EIL), were contracted to provide a report detailing the tests carried out and generated results in accordance with the Test Regime criteria, including calculations for Volume Weighted Average Return Temperatures (VWART).
- 1.1.3 The POD i405 has an identical space heating circuit with the only difference being on the DHW side as it has a smaller plate heat exchanger. Taking this into consideration the space heating test results are being brought forward from the original test report <u>IDEAL POD i505</u> **E4522-1A**, used in all necessary calculations and re-printed in this report.
- 1.1.4 To carry out the work involved to evaluate the performance of Domestic Hot Water (DHW) in accordance with the BESA UK HIU Test regime Technical Specification, Rev-009 October 2018, a publicly available online test regime. This is here-on referred to as the test regime throughout this document.

4 TEST METHOD

4.1 Installation of Appliance

4.1.1 The appliance was installed and commissioned (as received) and as defined in the product literature provided. Testing was carried out without further adjustment other than adjusting the setting of the DHW set points through the user interface on the HIU controller to suit the conditions of the HIU test rig. The HIU rig schematic is given in Figure 4.1.

4.2 Test Regime

- 4.2.1 The testing described in this report was carried out in accordance with the BESA test regime. The Test Regime outlines a series of static and dynamic tests to determine the performance of a HIU's DHW and SH functions. The Regime outlines the test method including the reporting of the results, the performance requirements and the VWART calculations.
- 4.2.2 The setup of the BESA tests is reproduced in Table 4.1. The basis of reporting the performance of the HIU from the BESA Test Regime is reproduced in Table 4.2.
- 4.2.3 The Test Regime specifies the testing of two different test temperature packages. The first is the high temperature package, with a district primary supply of 70 °C and the second is the 'low temperature' package, with a district primary supply temperature of 60 °C.
- 1.1.1 As the IDEAL POD i405 is suitable for both high and low temperature operation, both test packages were carried out and results recorded within this report.

4.3 Measurement & Uncertainties

- 4.3.1 All measurements and uncertainties adhere to the requirements stipulated in the BESA Test Regime. All measurements were sampled at a rate of 1 Hz for all tests.
- 4.3.2 The BESA uncertainties of measurement requirements are as follows: Differential Pressure, \pm 1 kPa; Temperature, \pm 0.1 °C; Volume Flow, \pm 1.5 %. Note: the time constant for the temperature sensors is less than 1.5 s.
- 4.3.3 EIL's reported uncertainty is based on a standard uncertainty by a coverage factor K=2, providing a level of confidence of approximately 95%. The uncertainty evaluation has been carried out in accordance with UKAS requirements. The EIL equipment list and uncertainties are given in Table 8.2, Appendix B.
